TUTORIAL 6
MIDTERM REVIEW
REMINDER

• Midterm is the Monday, June 18th, at 7:00pm – 8:50pm
• Look up your seat on Odyssey.
• Additional practice problems are available for each module. See “Additional Materials” on the course web page (Click Me!)
• No Assignment due in next week
DESIGN RECIPE

• Contracts:
  – Use the form
    
    fun_name: types consumed \rightarrow \text{type returned}
  – Use the **SINGLE ARROW** in contracts!
  – Make sure you use the correct type names (i.e `Str` not `String`; it’s `Float` not `Num` in Python, etc.)
  
    • Do not pluralize your type names
    • Capitalize your type names

• Requirements:
  – Include requirements to any of the types consumed, if it has any.
DESIGN RECIPE

• Purpose:
  – Make sure you mention all of the parameter names in your purpose and how they relate to what is being returned
  – Keep it short and simple; do not copy directly from the question!
  – Make it clear if you are “returning”, “printing”, or “mutating”.
  – Use return, not produce.

• Effects:
  • Be clear and concise on the different effects: printing, input, and mutation

• Examples/Tests:
  – For examples, make sure to have a base case and a non-base case at minimum
  – Example Format
    • Examples: \texttt{fn\_call(x1,x2,\ldots,xn)} => expected
  – Tests: \texttt{check.expect and check.within}
    – check.set_input (when \texttt{input()} is used)
    – check.set_screen (when information is printed)
 QUESTION 1 (MODULE 2 - CONDITIONALS)

• Let’s say we have large bricks that are 5 inches in length and small bricks that are 1 inch in length.

• Write a function called `enough_bricks` which has three parameters: `small`, the number of small bricks, `large`, the number of large bricks and `goal`, the length of a row we want to build. `enough_bricks` returns True if you can create a row with same length as `goal` with the number of small and large bricks available, False otherwise.

• Examples:
  - `enough_bricks(3,1,8) => True`
  - `enough_bricks(3,1,9) => False`

QUESTION 2 (MODULE 3 – STRINGS)

• Write a function called `ends_with_other` that consumes two strings, `s` and `t`, and returns `True` if `s` ends with `t` or if `t` ends with `s`, `False` otherwise. This function should be case insensitive.

• Examples:
  
  – `ends_with_other("abc", "Hi abc")` => True
  – `ends_with_other("HELLO", "hello")` => True
  – `ends_with_other("abc", "def")` => False

Source: Coding Bat, http://codingbat.com/prob/p174314
a) Write a function `multiples_of` that consumes a list of natural numbers (called `numbers`) and a positive natural number (called `n`), and returns a (new) list containing all entries in `numbers` which are multiples of `n`. The new list must be in the same relative order as `numbers`, and the original list should be unchanged. Use recursion or abstract list functions.

b) Write a function `modify_multiples` that consumes a list of natural numbers (called `numbers`) and a positive natural number (called `n`), and mutates `numbers` so that all multiples of `n` are set to 0. The function returns `None`. 
For example:

a) Constructing a new list:
   - `multiples_of([], 4) => []`
   - `multiples_of([18, 5, 19, 21, 300, 0, 4], 3) => [18, 21, 300, 0]`

   ✷ **Note:** The list that is consumed should remain the same.

b) **Mutating** numbers:
   # if `nums = []`, after calling
   #  `modify_multiples(nums, 4)`, `nums` is `[]`
   # if `nums = [18, 5, 19, 21, 300, 0, 4]`, after
   #  calling `modify_multiples(nums, 3),`
   #  `nums` is `[0, 5, 19, 0, 0, 0, 4]`
QUESTION 4 (MODULE 5 – ACCUMULATIVE RECURSION)

• Write an accumulatively recursive function `find_all` that consumes a list of strings `lst` and a string `s`, and returns the list of indices of positions in `lst` with string `s`. Recall that the first position in a list has index 0.

• For example,
  
  - `find_all(["a", "v", "d", "v"], "v") => [1,3]`
  
  - `find_all(["a", "v", "d", "v"], "q") => []`

QUESTION 5 (MODULE 5 – GENERATIVE RECURSION)

• Write an generative recursive function `find_all` that consumes a list of strings `lst` and a string `s`, and returns the list of indices of positions in `lst` with string `s`. Recall that the first position in a list has index 0.

• For example,
  - `find_all(["a", "v", "d", "v"], "v")` => `[1, 3]`
  - `find_all(["a", "v", "d", "v"], "q")` => `[]`
STUDY TIPS

• Review strategies:
  – Spaced practicing
  – Make own review notes
  – Good Sleep and Rest
  – Ask questions
  – Teach your friends
  – Come to office hours

• Review materials:
  – Course notes
  – Assignments
  – Tutorial Problems
  – Module Practices
  – Style Guide
