We normally publish the post-mortem for an assignment after it has been marked and released. Here is a list of common errors provided by the graders for assignment 6.

**Style and Spacing**

- Lines should be less than 80 characters long: excessively long lines should be broken up into multiple shorter lines, and make use of DrRacket’s auto-indenting features.

**General**

- Some students code did not run at all, hence they lost all correctness marks. You should always run your submission on your own computer to make sure it works before submitting.
- Helper functions should be defined before the functions that use them, and their definition should not interrupt the main function’s design recipe.

**Design Recipe**

- Purposes should meaningfully use each parameter name in the description of the function, and these references to the parameter names should be written exactly as they appear in the function header.
- Some students forgot to capitalize the type names in their contract (e.g. using nat instead of Nat).
- Some students forgot to include 2 distinct examples in the main functions.

**Question 1**

- Many students did not name their helper functions meaningfully. “helper” is not an acceptable name.

**Question 2**

- Some students used “poke-card” instead of “Poke-Card” in their data definition. By convention the first letter of a type name should be capitalized, and you should closely follow the instruction given in the question.
