Tutorial 2

- Quick review of C Syntax
- Translating Racket to C
- Implementing a ceiling function
Sample C Program

#include "cs136.h"

// sum_first_squares(n) calculates the sum
// 1^2 + 2^2 + 3^2 + ... n^2
// requires: n >= 0
int sum_first_squares(int n) {
    if (n) {
        return n * n + sum_first_squares(n - 1);
    } else {
        return 0;
    }
}

int main(void) {
    printf("sfs(10) = %d\n", sum_first_squares(10));
}
The previous program illustrates many C syntax elements.

- `#include "cs136.h"` (ignore for now)
- purpose statement, requires in contract
- use of `{}`, `()`, indentation, `;`
- static *typing*: `int x`
- any non-zero value is “true”
- `if`, `return`
- `int main(void)`
- `printf` syntax with "%d"
Translate the following functions into C:

```c
#define (min a b) 
   (cond [((<= a b) a] 
         [else b]])

#define (min4 a b c d) 
   (min (min a b) (min c d)))

#define (sum-digits n) 
   (cond [((< n 10) n] 
          [else (+ (remainder n 10) 
                  (sum-digits (quotient n 10))))]))
```
Integer Division

Define the following C function:

// ceiling(a,b) produces the value of a/b, rounded up to
// the next largest integer
// requires: a >= 0, b > 0
Recursion with side effects

Define the following C function: (use recursion)

```c
// fizzbuzz(n, fizz, buzz) produces a sequence
// from 1 ... n with the following replacements:
// replace numbers with divisible by fizz with fizz
// replace numbers divisible by buzz with buzz
// replace numbers divisible by both with fizzbuzz
// requires: 1 <= fizz, buzz, n
```

For example:

```c
fizzbuzz(16, 3, 5) produces the output:
1 2 fizz 4 buzz fizz 7 8 fizz buzz 11 fizz 13 14 fizzbuzz 16.
```

(note the spacing and the final period)
