Tutorial 2

- Quick review of C Syntax
- Translating Racket to C
- Implementing a ceiling function
# Sample C Program

```c
#include "cs136.h"

// sum_first_squares(n) calculates the sum
// 1^2 + 2^2 + 3^2 + ... n^2
// requires: n >= 0
int sum_first_squares(int n) {
    if (n) {
        return n * n + sum_first_squares(n - 1);
    } else {
        return 0;
    }
}

int main(void) {
    printf("sfs(10) = %d\n", sum_first_squares(10));
}
```
The previous program illustrates many C syntax elements.

- `#include "cs136.h"` (ignore for now)
- `purpose` statement, `requires` in contract
- use of `{}`, `()`, indentation, `;`
- `static typing: int x`
- any non-zero value is “true”
- `if, return`
- `int main(void)`
- `printf` syntax with "%d"
Racket Translation

Translate the following functions into C:

\[
\text{(define (min a b)
  (cond [(<= a b) a]
        [else b]))}
\]

\[
\text{(define (min4 a b c d)
  (min (min a b) (min c d)))}
\]

\[
\text{(define (sum-digits n)
  (cond [(< n 10) n]
        [else (+ (remainder n 10)
                 (sum-digits (quotient n 10)))]))}
\]
Integer Division

Define the following C function:

```c
// ceiling(a,b) produces the value of a/b, rounded up to
// the next largest integer
// requires: a >= 0, b > 0
```
Recursion with side effects

Define the following C function: (use recursion)

```c
// fizzbuzz(n, fizz, buzz) produces a sequence
// from 1 ... n with the following replacements:
// replace numbers with divisible by fizz with fizz
// replace numbers divisible by buzz with buzz
// replace numbers divisible by both with fizzbuzz
// requires: 1 <= fizz, buzz, n
```

For example:

```c
fizzbuzz(16, 3, 5) produces the output:
```

```c
1 2 fizz 4 buzz fizz 7 8 fizz buzz 11 fizz 13 14 fizzbuzz 16.
```

(note the spacing and the final period)
